

How to run our project to work on it

1. Download Rust from <https://www.rust-lang.org/learn/get-started>
2. Download the extension on Vscode under rust-analyzer made by rust-lang.org
3. Create a project using this command on the terminal:
 - a. Cd to the directory you want to save the project in
 - b. Run: `cargo new project_name`
4. To run the code type in the command terminal: `cargo run`
 - a. This command “cargo run” will execute whatever is in the main.rs file under the src folder in the project directory

How to run get_OS function:

- So to run the get_OS function all you have to do is type in the command terminal this: `cargo run -- "get_os"` to give the cargo run the input it needs which is the pre-defined function get-os
